- I imported the previous work into the new work environment and changed the links according to what was taught in class. The HTML pages I brought in are: homePage, ComtactMe.

- I designed a basis for the new HTML pages as taught in class and made an "Include" for a suitable title for all the pages. I designed the Footer for the relevant pages for this work only and it is implemented using Include at the base for these pages.

- At work- assignment3_1 I implemented the requirements by creating a recommended song list. Because this is a site that is also open to little girls who want inspiration, the songs with the rude names should be censored.

- If a user enters the page and the current song list is not ready (which can happen for a few hours a month) he will be upset so I put him a cute picture of a dog to put a smile on his face.

- In work-assignment3_2 I implemented the requirements for a search form when the list of users and their details displayed does not contain sensitive information such as passwords.

- For the site registration form I did not let the user to not fill in one of the inputs means that in order to submit the form and realize the registration the user must fill out everything.
